

Design Document and Hello World version of our project:
(We were told to do them together since our project is updating the documentation)

- Table of contents: (along left hand side)
 - Home (landing page)
 - Web Server Configuration (previously Deployment)
 - Quickstart
 - PostgreSQL Configuration
 - Git Configuration
 - Install Go
 - Python Virtual Environment Configuration
 - Loading Repositories
 - Detailed Installation (previously Getting Started)
 - Database setup
 - Installation
 - Collecting data
 - Augur's Frontend
 - Command Line Interface
 - Development Guide (do not change)
 - Installing for development
 - Make commands
 - Logging
 - Writing documentation
 - Workers
 - Create a Metric
 - CLI (Command Line Interface)
 - Testing
 - Configuration file reference
 - REST API Documentation (do not change)
 - Docker (do not change)
 - Docker Quick Start
 - Getting Started
 - Docker
 - Docker Compose Deployment
 - Docker Compose with the script (recommended)
 - Docker Compose without a script
 - Interacting with the containers
 - Schema (do not change)
 - Complete Data Model on a Page
 - Focus: Issues
 - Focus: Commits
 - Focus: Pull Requests
 - Focus: Contributors
 - Focus: Dependencies

- Home page specifications (landing page)
 - Short intro paragraph explaining what Augur is
 - List contributors
 - Navigate section
 - Describe what each section is and where to go based on their wants and needs
- Web Server Configuration specifications
 - Previously Deployment section
 - Take out Setting up an Augur server as its very redundant with the Quickstart
 - Add an example of how to launch an EC2 instance and the memory/space requirements that would be needed
- Quickstart specifications
 - Add section to answer questions that come up while running 'make install-dev' command
 - This was a big problem for many groups when first installing so we thought it would be helpful for new users to understand what choices to make for the easiest installation process
- Detailed Installation specifications
 - Database setup is already very similar to Quickstart, probably leave alone
 - Installation
 - Take out macOS specifics and move to new subsection
 - Move Dependencies section to the top and then move straight install Augur installation after that to make more consistent with Quickstart
 - Leave Collecting data, Augur's Frontend, and Command Line interface alone
 - Add section to answer questions that come up while running 'make install-dev' command
 - This was a big problem for many groups when first installing so we thought it would be helpful for new users to understand what choices to make for the easiest installation process
